As far as we know, most of the spreadsheet applications are for small business. Spread for Windows Forms is specially designed for medium business spreadsheet. Try Spread for Windows Forms 5.52 download from our site. What is Spread for Windows Forms? Spread for Windows Forms is the best spreadsheet component for the FarPoint 2.0 application. FarPoint Spread for Windows Forms is an Excel like spreadsheet component that is designed to replace Excel formulas within a Windows Forms application. Add, Copy, Cut and Paste and all the user typically require within an Excel application can be performed within a Windows Form application with a single line of code. Features: Quick Edit using VScrollBar support User-defined ranges: Instead of having a range of cells from A1 to D5, let's say we have a range from A1 to F4 and want to display the value of H1. So we would not need to set cell H1 to ="H1" instead we'd just need to name the range h1. These functions create formulas for the rows and columns of the spread sheet. This component supports these functions. The text of the formula would look like the following: Function Add(a, b) as String For example, we would copy the following code: Function Add(a, b) As String and would produce the following in the spreadsheet: In this example, the function has been called Add, we do not want to display cell H1, instead we want the value of cell H1 to equal (or be equal to) the sum of cells A1 and B1. In other words we want to sum the values of cells A1 and B1 and place the answer in cell H1. For more info about spread for windows forms refer Spread for Windows Forms documentation below and link.
